Electron Linac

Yujiro Ogawa

KEK, High Energy Accelerator Research Organization Accelerator Laboratory

Linac = Linear Accelerator

Outline – Electron Linac –

Introduction

Roles, Types, Beams, Length...of linacs are described so that you could get some image of linear accelerators.

• Principles of Particle Acceleration in RF Linacs Basic knowledge of electromagnetism, mechanics, special relativity is assumed.

Problems concerning principles of acceleration are categorized into three items through

"intuitive explanation" two of which are clarified by "rigorous treatment"

 Electron Linear Accelerator Remained problems concerning

> "bunching mechanism" "transverse motion"

are discussed in detail. KEK electron / positron linac is introduced as an example.

- (Advanced Concepts)
- Conclusion

Introduction

•Roles of Electron Linacs

1. Injection into circular accelerators for various applications SPring8, PF(SR) KEKB, PEPII(high energy physics)...

2. Low-emittance linac for advanced light source FEL, ERL(Energy Recovery Linac)...

3. Linear collider for future high energy physics

4. Medical applications (the most familiar?)

key issue : "accelerate charged particles efficiently" Introduction (cont'd)

Cheiron School Spring-8 Sep 13 2007

•Two Basic Elements of Linacs (G. A. Loew)

1. Accelerating Structure 2. Particle Beam

1. Accelerating Structure — It depends on types of linacs.

DC linacs

- DC electric field to accelerate beams

Limited to a few tens of MeV

Induction linacs

 Based on Faraday's law
 Changing magnetic fluxes to generate the accelerating electric fields
 Used in medium-energy high-current pulsed applications

Introduction (cont'd)

1. Accelerating Structure (cont'd)

RF linacs : Main subject in this lecture

- Frequency UHF, Microwave (L, S, C, X-band), Laser...
- CW or Pulsed
- Traveling-wave or Standing-wave
- Room Temperature or Superconducting
- Utilize Cavity (Resonance) Structure
- Used for a wide spectrum of applications from injectors to high-energy accelerators, medical accelerators...

Introduction (cont'd)

2. Particle Beam

Protons and Heavier Particles :

 Main particles in early developments of RF linacs High-frequency efficient RF devices did not exist. Imagine a maximum frequency of 1 MHz. Relativistic particles travel 300 m in a single period!! -> Too large apparatus.

- Nowadays: RF frequency >= 200 MHz

Electrons and Positrons : Main subject in this lecture – Technological innovation during the war : Invention of high power klystrons made it possible that electrons can be accelerated in realistic sizes. (e.g. 2856 MHz high-power klystrons)

Introduction (cont'd)

•Length of Electron Linacs

Cheiron School Spring-8 Sep 13 2007

Longer linacs, higher energy. – SLAC : Longest in the world 3-km linac -> SLC 50 GeV (1989) – KEK : 600-m J-shaped linac -> KEKB linac 8 GeV (1998) – LAL : 230-m linac, 2.3 GeV (1968)

Principles of Particle Acceleration in RF Linacs

•Intuitive Explanation

[1] Assume the existence of "longitudinal electric fields of traveling microwaves".
[2] Imagine charged particles surf on "a crest of traveling microwaves".
[3] The velocity of the charged particles should equal the phase velocity of microwaves for continuous acceleration.

Charged Particle 🔵 🗕

Longitudinal electric field of traveling microwaves

Principles of Particle Acceleration in RF Linacs •Equation of motion

 $\frac{dp_z}{dt} = eE_z(z,t)$ Longitudinal electric field of traveling microwaves $E_z(z,t) = E_{z0} \sin \left[\omega \left(t - \int_0^z \frac{dz'}{v_p} \right) \right]$ Charged Particle

 v_p : phase velocity

Z

 ω : angular frequency

Longitudinal electric field of traveling microwaves

Principles of Particle Acceleration in RF Linacs

•Synchronized Particles if $v_{zp} = v_p$ $\frac{dp_{zp}}{dt} = eE_{z0} \sin \phi_p$ $\phi_p \equiv \omega \left(t - \int_0^z \frac{dz'}{v_p} \right) = \text{constant}$

Particles on the synchronized phase ϕ_p can be efficiently accelerated.

Charged Particle

 v_p : phase velocity

Longitudinal electric field of traveling microwaves

 ω : angular frequency

Principles of Particle Acceleration in RF Linacs

•The story, however, does not end: The intuitive explanation is apparently right and easy to understand, but actually not enough, even superficial for serious students.

•There are many fundamental and technical issues to be resolved.

Can you point out what the problems are?

[1] Electromagnetic waves are "transverse" in free space. How do you make "longitudinal" waves?

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity?

[3] How do you make many particles localized in a very short length so as to be uniformly accelerated on 12 a crest of the wave? ===> next section

Principles of Particle Acceleration in RF Linacs

[1] Electromagnetic waves are "transverse" in free space. How do you make "longitudinal" waves?

Before going into detail, you should notice that the electric field in vacuum must satisfy

 $\operatorname{div}\vec{E}=0$

How about our longitudinal electric field? $E_{z}(z,t) = E_{z0} \sin \left[\omega \left(t - \int_{0}^{z} \frac{dz'}{v_{p}} \right) \right]$

 E_{z0} must depend on transverse coordinates.

 $E_{z0}(x,y)$

One needs to go back to the principle of the issue: "Electromagnetism"

Principles of Particle Acceleration in RF Linacs

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Example: Circular wave guide

 TM_{01} mode : Transverse Magnetic Wave

A longitudinal electric field exists! But how about the phase velocity? The wave and the particles must be synchronous.

The phase velocity seems greater than the velocity of light.

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Example: Circular wave guide

Let's start with a wave equation in cylindrical coordinates

$$\frac{\partial^2 E_z}{\partial r^2} + \frac{1}{r} \frac{\partial E_z}{\partial r} + \gamma^2 E_z = -\frac{\omega^2}{c^2} E_z \qquad \begin{array}{l} E_z \propto e^{i\omega t - \gamma z} \\ \gamma : \text{ complex wave number} \end{array}$$

Solutions for axial symmetric TM₀₁ mode are written as:

$$E_{z} = CJ_{0}(k_{c}r)e^{-\gamma z}$$

$$H_{\theta} = \frac{j\omega\epsilon_{0}}{k_{c}}CJ_{1}(k_{c}r)e^{-\gamma z} \qquad k_{c}^{2} = \gamma^{2} + (\frac{\omega}{c})^{2}$$

$$E_{r} = \frac{\gamma}{k_{c}}CJ_{1}(k_{c}r)e^{-\gamma z}$$

$$E_{z} = 0 \text{ at } r = b \Longrightarrow J_{0}(k_{c}b) = 0 \Longrightarrow k_{c}b = \frac{2\pi}{\lambda_{c}}b = 2.405$$

$$\Longrightarrow \lambda_{c} = 2.61b : \text{ cut-off wavelength}$$
16

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity?
 Example: Circular wave guide Dispersion relation for an axial symmetric TM₀₁ mode

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity?

Example: Circular wave guide

The dispersion relation for the axial symmetric TM_{01} mode tells us that the phase velocity is greater than the velocity of light. The relation :

 $v_p > c > v_g$

is always valid for electromagnetic waves traveling in uniform wave guides.

The particle velocity can not exceed the velocity of light. Therefore we can not accelerate the charged particles by using uniform wave guides.

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity?

How do we slow down the phase velocity in a wave guide?

A quick thought: Introduce some obstacles in wave guides to slow down the phase velocity: non-uniform wave guide.

The simplest and frequently-used structure is the diskloaded wave guide: "slow-wave structure".

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Disk-loaded wave guide: Pillbox resonator chain

Before going into detail, we investigate a single pillbox resonator.

 $E_z = CJ_0(k_c r)$ $H_{\theta} = i \frac{C}{Z_0} J_1(k_c r)$

 $\omega = \omega_c = k_c c = 2.405 \frac{c}{b}$ $Z_0 = \sqrt{\frac{\mu_0}{\epsilon_0}} = 377 \ \Omega : \text{ impedance of free space}$

The frequency is independent of the length "d".

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Disk-loaded wave guide: Pillbox resonator chain

The lowest mode TM_{010} of the pillbox resonator has the resonant frequency which is independent of the resonator length.

Then the chained resonators can be phased independently in the weak coupling limit so that the phase velocity could be adjusted to the particle velocity...

But our disk-loaded wave guides have larger iris holes: larger coupling.

Let's treat the irises as perturbations and see what happens to the wave guide modes.

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Disk-loaded wave guide: Pillbox resonator chain

The electromagnetic wave experiences a lot of reflections at each iris and interferes either destructively or additively.

Destructive case:

The irises have a minor effect. It's OK. Additive case:

Standing waves are created. $v_g = 0$ This could make the dispersion curve flattened at the condition ("Bragg" reflection):

$$2\beta d = 2n\pi \longrightarrow \beta = \frac{\pi}{d}n \quad n = 0, 1, 2, \dots$$

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Disk-loaded wave guide: Pillbox resonator chain

Schematic dispersion curves of disk-loaded wave guides

Principles of Particle Acceleration in RF Linacs

[2] How do you adjust the phase velocity of the electromagnetic wave to the particle velocity? Disk-loaded wave guide: Pillbox resonator chain

Actual dispersion curves of disk-loaded wave guides

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain

We have verified that a slow-wave structure exists.

More theoretical treatment is based on the "Floquet's Theorem" for wave propagation in a periodic structure.

Floquet's theorem for TM₀₁ mode

$$E(r, z_1 + d, t) = e^{-i\beta_0 d} E(r, z_1, t)$$

The theorem comes from the fact that when a structure of infinite length is displaced along its axis by one period, it can not be distinguished from its original self.

26

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain

Electromagnetic fields of TM_{01} mode can be expanded in a spatial Fourier series (space harmonics) by using Floquet's theorem.

$$E_{z}(r, z, t) = \sum_{\substack{n = -\infty \\ n = -\infty \\ \infty}} a_{n} J_{0}(k_{rn}r) e^{i(\omega t - \beta_{n}z)}$$

$$E_{r}(r, z, t) = i \sum_{\substack{n = -\infty \\ \infty \\ \infty}}^{\infty} a_{n} \frac{\omega}{k_{rn}v_{pn}} J_{1}(k_{rn}r) e^{i(\omega t - \beta_{n}z)}$$

$$B_{\theta}(r, z, t) = i \sum_{\substack{n = -\infty \\ n = -\infty \\ \infty}}^{\infty} a_{n} \frac{\omega}{k_{rn}c^{2}} J_{1}(k_{rn}r) e^{i(\omega t - \beta_{n}z)}$$

$$k_{rn} = i \frac{\omega}{v_{pn}} \sqrt{1 - \left(\frac{v_{pn}}{c}\right)^{2}}$$

$$v_{pn} = \frac{\omega}{\beta_{n}} = \frac{\omega}{\beta_{0} + \frac{2\pi n}{d}}$$

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain

Brillouin diagram for a disk-loaded wave guide

Basically only the intersections of the dispersion curves and the line of $27 v_p = c$ affect beam dynamics.

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain Distinctive characteristics [1] There are "space harmonics". $n = 0, n = \pm 1, ...$ (a) Each has a different propagation constant. β_n (b) Each has a different phase velocity. $v_{pn} = \frac{1}{\beta_n} = \frac{1}{\beta_0 + \frac{2\pi n}{d}}$ **Example:** $TM_{01}: 2\pi/3 \mod (\beta_0 = 2\pi/3d)$ $:: n = 0 : v_p = c$ $n = 1 : v_p = -c/4$ unloaded wave guide $\frac{d\omega}{d\beta} = v_g/c$ n = -1: $v_p = -c/2$ TM_{11} $TM_{0\overline{1}}$ = 1 $-2\pi/d$ $-\pi/d$ π/d $2\pi/d$ Brillouin diagram for a disk-loaded wave guide ==>We can adjust the phase velocity to the velocity of light. 28

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain

Distinctive characteristics

[2] When n = 0 and $v_p = c$,

the forces acting on the charged particle are simply expressed by:

 $F_z(r, z, t) = ea_0 e^{i\omega(t-z/c)}$ $F_r(r, z, t) = e(E_r - vB_\theta) = i\frac{ea_0\omega}{2c}(1 - v/c)re^{i\omega(t-z/c)}$

 $k_{r0} = 0 \Longrightarrow J_0(k_{r0}r) = 1 , J_1(k_{r0}r)/k_{r0} \to r$

The accelerating force is independent of the radial position of the synchronous particle.

•• The radial force is proportional to the radial position and divergent, but becomes zero as the particle velocity approaches the velocity of light.

==>Extremely fortunate for the operation of electron linacs!!! ²⁹

Principles of Particle Acceleration in RF Linacs

Disk-loaded wave guide: Pillbox resonator chain Remarks: Some important items not investigated in this lecture.

[1] How the choice of the phase shift per period of the fundamental mode (TM_{01}) is made?

It is made empirically...

 $2\pi/3$ mode is mostly chosen for traveling-wave linacs because acceleration efficiency is high, and it is robust against the instability due to higher modes.

[2] The existence of higher pass bands such as TM₁₁ mode may be responsible for serious instabilities in the linac operation.

Electron Linear Accelerator

Remaining problem in the preceding section:

[3] How do you make many particles localized in a very short length so as to be uniformly accelerated on a crest of the wave?

==> "bunching mechanism in electron linacs"

Start with a longitudinal equation of motion:

 $\frac{dp_z}{dt} = eE_z(z,t)$

where a longitudinal electric field of traveling microwaves:

$$E_z(z,t) = E_{z0} \sin \left[\omega \left(t - \int_0^z \frac{dz'}{v_p} \right) \right]$$

Assume synchronous particles:

$$\frac{dp_{zp}}{dt} = eE_{z0}\sin\phi_p$$
$$\phi_p \equiv \omega(t - \int_0^z \frac{dz'}{v_p}) = \text{constant}$$

31

Electron Linear Accelerator

"bunching mechanism in electron linacs"

Define a small displacement from the synchronous particle:

 $z = z_p + \xi \qquad \dot{z} = v_p + \xi$

The equation of motion is represented by $\,\xi\,$ and $\phi_p\,$.

$$\frac{dp_z}{dt} = eE_{z0}\sin\left(\phi_p - \omega\int\frac{d\xi}{v_p}\right)$$

Since the right-hand side does not explicitly depend on time, we can consider an energy integral so that a potential energy could be defined by:

$$U(\xi) = -\int eE_{z0}\sin\left(\phi_p - \omega \int \frac{d\xi}{v_p}\right)d\xi$$

Then we can calculate a Lagrangian:

$$L = -mc^2 \sqrt{1 - \beta^2} - U(\xi) \ , \ \beta \equiv \frac{v_p + \xi}{c}$$

Electron Linear Accelerator

"bunching mechanism in electron linacs"

 $\left|\dot{\xi}/v_p\right| \ll 1$

In an approximation of slow displacement variation:

The Lagrangian is expanded to a second order of ξ .

$$\begin{aligned}
\mathcal{L} &= -mc^2 \sqrt{1 - \beta_p^2 + p_{zp} \dot{\xi} + \frac{1}{2} m_l \dot{\xi}^2 - U(\xi)} \\
\beta_p &\equiv v_p/c \quad p_{zp} \equiv \frac{mc\beta_p}{\sqrt{1 - \beta_p^2}} \quad m_l \equiv \frac{m}{\left(1 - \beta_p^2\right)^{3/2}}
\end{aligned}$$

where m_l is a so-called longitudinal mass. Defining a longitudinal momentum $p_l \equiv m_l \dot{\xi}$, and using a canonical momentum:

$$p_{\xi} = \frac{\partial L}{\partial \dot{\xi}} = p_{zp} + p_l$$

Electron Linear Accelerator

"bunching mechanism in electron linacs"

The Hamiltonian is obtained as

$$H = mc^2 \sqrt{1 - \beta_p^2} + \frac{1}{2m_l} \left(p_{\xi} - p_{zp} \right)^2 + U(\xi)$$

For simplicity, assume v_p is treated as a constant, then redefine a longitudinal potential energy:

 $U_l(\xi) \equiv U(\xi) + eE_{z0}\xi\sin\phi_p$

The new Hamiltonian concerning a particle motion is written as:

$$H = \frac{p_l^2}{2m_l} + U_l(\xi)$$
$$U_l(\xi) = -eE_{z0} \left[\frac{v_p}{\omega} \cos\left(\phi_p - \frac{\omega\xi}{v_p}\right) - \xi \sin\phi_p \right]$$

-0.2

 $U_l(\xi)$

 p_l

Electron Linear Accelerator

"bunching mechanism in electron linacs"

The phase space, the longitudinal potential and the generalized force are shown in the figure.

$$H = \frac{p_l^2}{2m_l} + U_l(\xi)$$

 $\frac{\partial U_l}{\partial \xi}$

$$U_l(\xi) = -eE_{z0} \left[\frac{v_p}{\omega} \cos\left(\phi_p - \frac{\omega\xi}{v_p}\right) - \xi \sin\phi_p \right]$$

The electrons could be trapped in a potential well: a local "" minimum, oscillating in a relatively narrow region.

 p_l

Electron Linear Accelerator

"bunching mechanism in electron linacs"

To get "bunched beam", we increase the phase velocity of the microwave and the electric field <u>adiabatically</u>.

Adiabatic theorem of Ehrenfest:

An action variable of a mechanical system in periodic motion is conserved when the system changes adiabatically.

$$J = \frac{1}{2\pi} \oint p dq = \text{constant}$$

(q, p): canonical variables

Electron Linear Accelerator

"bunching mechanism in electron linacs"

Before using the Ehrenfest's theorem, write ^{pl} down the Hamiltonian for electrons trapped in a potential well, which is undergoing small oscillations.

Electrons move along an ellipse in the phase space.

 p_l

 $\frac{eE_{z0}\omega\cos\phi_p}{m_l v_p}$

 $\omega_p = \sqrt{2}$

Electron Linear Accelerator

 p_l

 $2\pi J$

 $\sqrt{2m_lE_l}$

"bunching mechanism in electron linacs" Calculation of the action variable: If the total energy is E_l , the area of the phase space is expressed as

$$2\pi J = \pi \sqrt{2m_l E_l} \sqrt{2E_l/m_l \omega_p^2} = 2\pi E_l/\omega_p$$

Then we obtain the relation:

 $E_l/\omega_p = J = \text{constant}$

 $2E_l/m_l\omega_p^2$

===The Ehrenfest's adiabatic theorem===

Electron Linear Accelerator

"bunching mechanism in electron linacs"

Maximum amplitude and momentum are derived:

Adiabatically increasing the phase velocity and the longitudinal electric field, the bunch shrinks down, while

the momentum spread stretches out.

Electron Linear Accelerator

"bunching mechanism in electron linacs"

Remarks:

Even the momentum spread, which stretches out in the bunching process, is damped in the sense that we are usually interested in the fractional momentum spread:

Electron Linear Accelerator

We have studied a longitudinal motion of electrons in linacs with particular emphasis on the bunching process.

After sufficiently bunched and accelerated to several tens of MeV, the electrons can be treated as rigid particles in a longitudinal direction. The relativistic beta is very close to one.

As a consequence of this favorable fact, you can just put the electrons on a crest of the microwave for efficient acceleration.

Comment: The electron bunch has a finite length, which causes the energy spread depending on the phase of the microwave on which you put it.

Electron Linear Accelerator

How about a transverse motion of electrons?

Next subject: "transverse motion in electron linacs"

In the relativistic region $v \to c$, the transverse force caused by the microwave (TM₀₁ mode) vanishes.

 $F_r(r, z, t) = e(E_r - vB_\theta) = i\frac{ea_0\omega}{2c}(1 - v/c)re^{i\omega(t - z/c)} \Longrightarrow 0$

Transverse equation of motion (x):

$$\frac{dp_x}{dt} = F_x$$
where
$$p_x = \frac{m}{\sqrt{1 - \beta^2}} \frac{dx}{dt} = m\gamma \frac{dx}{dt}$$

$$c\beta = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} \quad \gamma = \frac{1}{\sqrt{1 - \beta^2}} = \frac{E}{mc^2}$$
42

Electron Linear Accelerator

"transverse motion in electron linacs"

The transverse equation of motion is rewritten as

$$m\frac{d}{dt}\left(\gamma\frac{dx}{dt}\right) = F_x$$

Changing the independent variable: $ds = c\beta dt$

$$m\frac{d}{ds}\left(\beta\gamma\frac{dx}{ds}\right) = \frac{F_x}{\beta mc^2}$$

 $m\frac{d^2x}{ds^2} + \frac{\gamma'}{\gamma}\frac{dx}{ds} = \frac{F_x}{\gamma mc^2}$

For ultra relativistic case (electrons): $\beta \rightarrow 1$

We have a damping term: $\frac{\gamma'}{\gamma} \frac{dx}{ds}$

which is fortunate in operating electron linacs. "More accelerate, more stable in a transverse motion." 43

Electron Linear Accelerator

"transverse motion in electron linacs"

Adiabatic Damping To be precise, the term of "damping" might be inappropriate, because there is actually no dissipation.

Solve the equation of motion in the conditions of:

constant acceleration gain: $\gamma = \gamma_0 + gs \ \gamma' = g = \text{constant}$ no external focusing force: $F_x = 0$

$$\frac{d^2x}{ds^2} + \frac{g}{\gamma_0 + gs}\frac{dx}{ds} =$$

The solution is: $x = x_0 + x'_0 \frac{\gamma_0 + gs}{g} \ln \frac{\gamma_0 + gs}{\gamma_0 + gs_0}$ $x' = x'_0 \frac{\gamma_0 + gs_0}{\gamma_0 + gs}$ High-energy region

$$\implies x = x_0 + x_0' s_0 \ln \frac{s}{s}$$

 $\implies x' = x'_0 \stackrel{s_0}{-}$

44

Electron Linear Accelerator

"transverse motion in electron linacs"

Adiabatic Damping

Electron orbits are logarithmic.

It is as if the length $s - s_0$ has been contracted to $L_{eff} = s_0 \ln \frac{s}{s_0}$. Example: KEK linac $s_0 = 10 \text{ m}$ s = 600 m $\gamma' = g = 39.14 \text{ /m} \implies L_{eff} = 40.9 \text{ m}$ 45

Electron Linear Accelerator

"transverse motion in electron linacs"

Transverse emittance is defined as a phase space area: $u_x \equiv \int \int dx dp_x$

Liouville's theorem states that u_x might be conserved if only non-dissipative forces act on the particles.

Comment: The general definition of phase space volume is written as

 $U_6 \equiv \int \int \int \int \int dx dp_x dy dp_y d\theta d\gamma$ This must be conserved. Usually the coupling between different components, however, is weak so that the subphase space, e.g., the projected phase space volume is conserved.

Transverse emittance in accelerators is defined as:

 $\pi \epsilon_x = \int \int dx dx'$ $x' = p_x/p_z = p_x/\gamma\beta mc$ Therefore $\gamma \beta \epsilon_x$, "normalized emittance" is conserved. 46

Electron Linear Accelerator KEK electron / positron linac

KEK Linac operation statistics:

Annual operation time: >7000 hours = 10 months High availability of 98 % has been maintained.

KEK Electron / Positron Linac Operation History

(Advanced Concepts)

High-gradient acceleration: Laser plasma acceleration Electron beam driven acceleration

High-brightness electron-beam generation: (Shintake's lecture) XFEL(LCLS SLAC, SCSS Spring8) RF Gun

ERL: Energy Recovery Linac: (Shintake's lecture)

Instead of stating my **Conclusion**

Important lessons:

[1] Injector performances determine the beam characteristics in linacs.

"How it ends depends on how it begins"

[2] The accelerator is just one of the science instruments, but without knowing science, especially physics very well, it can not be even constructed and operated stably so that it could not really serve as a good and efficient tool for science experiments.

At first there was no wall between accelerator and science. Users used to construct and operate accelerators. Today we need mutual exchange for future development.

"We build too many walls and not enough bridges." (Isaac Newton)

====>Please join us to develop new accelerators.
